PSF-200 BG INFILL

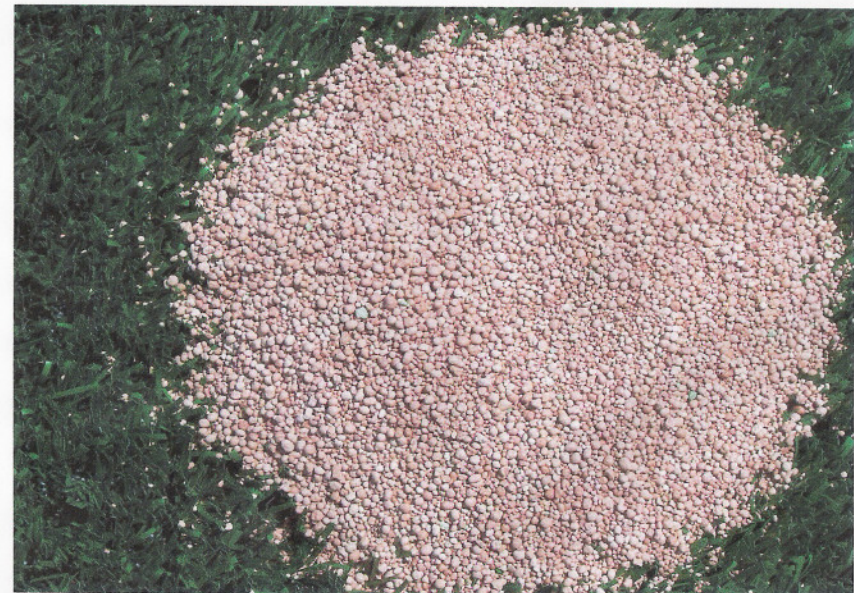

Synthetic turf infill

A unique filler for synthetic turf applications.

Sports Fields

Landscape Turf

Playgrounds

Good for you, good for the environment!

Infill choices don't need to be limited to just rubber, elastomers, polymers, or sand. There is an alternative with many positive health, environment, and economic attributes.

PSF 200 BG infill is a unique and innovative infill made from post consumer materials. It is a rounded material that will not compact over time and can be used for topdressing existing fields as well as the entire infill for new fields. PSF 200 BG works well with many different types of turf and provides for a very playable surface for all sports.

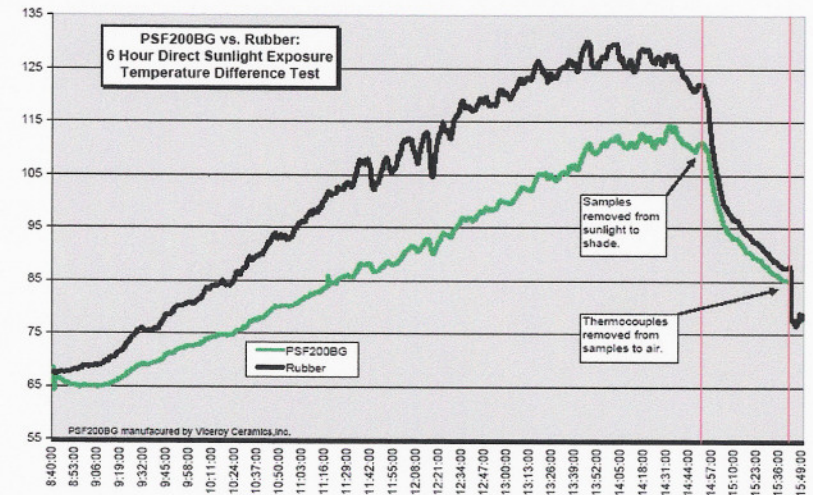

PSF 200 BG is much lower in temperature than existing infills, will not support bacterial activity, and has no heavy metals or hazardous materials in its composition. When used in new construction, this infill can be removed from the worn out turf, stockpiled on site, and re-used for the next new turf field if you choose to do so.

If the decision is made to replace the PSF 200 BG infill, then the product can be recycled back as an input for construction materials or used as a soil amendment for grassy areas, flower beds, or gardens. PSF 200 BG never needs to end up in the landfill!

Colors available are Cool Green and Tan as shown in the brochure.
